

New Product Announcement

MedicScanOCR

True Parse

Finally, a true solution for scanning and retrieving information from medical insurance cards! Not only can MedicScanOCR True Parse automatically extract vital information from the insurance cards, but it can place the data into appropriate fields. In addition to this, the image of the card will become interactive, allowing the user to select specific fields, parts of a field, or even multiple fields together for additional extraction.

The image of the insurance card is interactive and can be used as follows:

1. You can click on one of the fields located on the right panel and then move the mouse to any one of the highlighted fields on the insurance card. One left click on a field will then copy the data to the selected field on the right panel.
2. Pressing the shift button and clicking on one of highlighted fields on the insurance card will then enable you to drag and drop the data to your application.
3. If you left click and drag on a highlighted field you can then copy part of the field; the text captured will appear at the bottom panel. You have the option of using this feature if you only need a certain part of a field to appear.
4. A left click and drag on multiple highlighted fields will allow you to copy the text from all selected fields in the order you selected them. Use this option if you want to capture multiple lines such as an address.
5. In addition, rolling the scroll button on the mouse will enable you to switch between the unassigned fields on the right panel.
